Introduction to TensorFlow Part II

QUIZ

<https://forms.office.com/e/nzMLjsQd5m>

ASSIGNMENTS

ASSIGNMENTS: WHO WILL PRESENT NEXT?

INPUT: PERFORMANCE ESTIMATION

Why do we split the data into training and validation set?

INPUT: PERFORMANCE ESTIMATION

Why do we split the data into training and validation set?

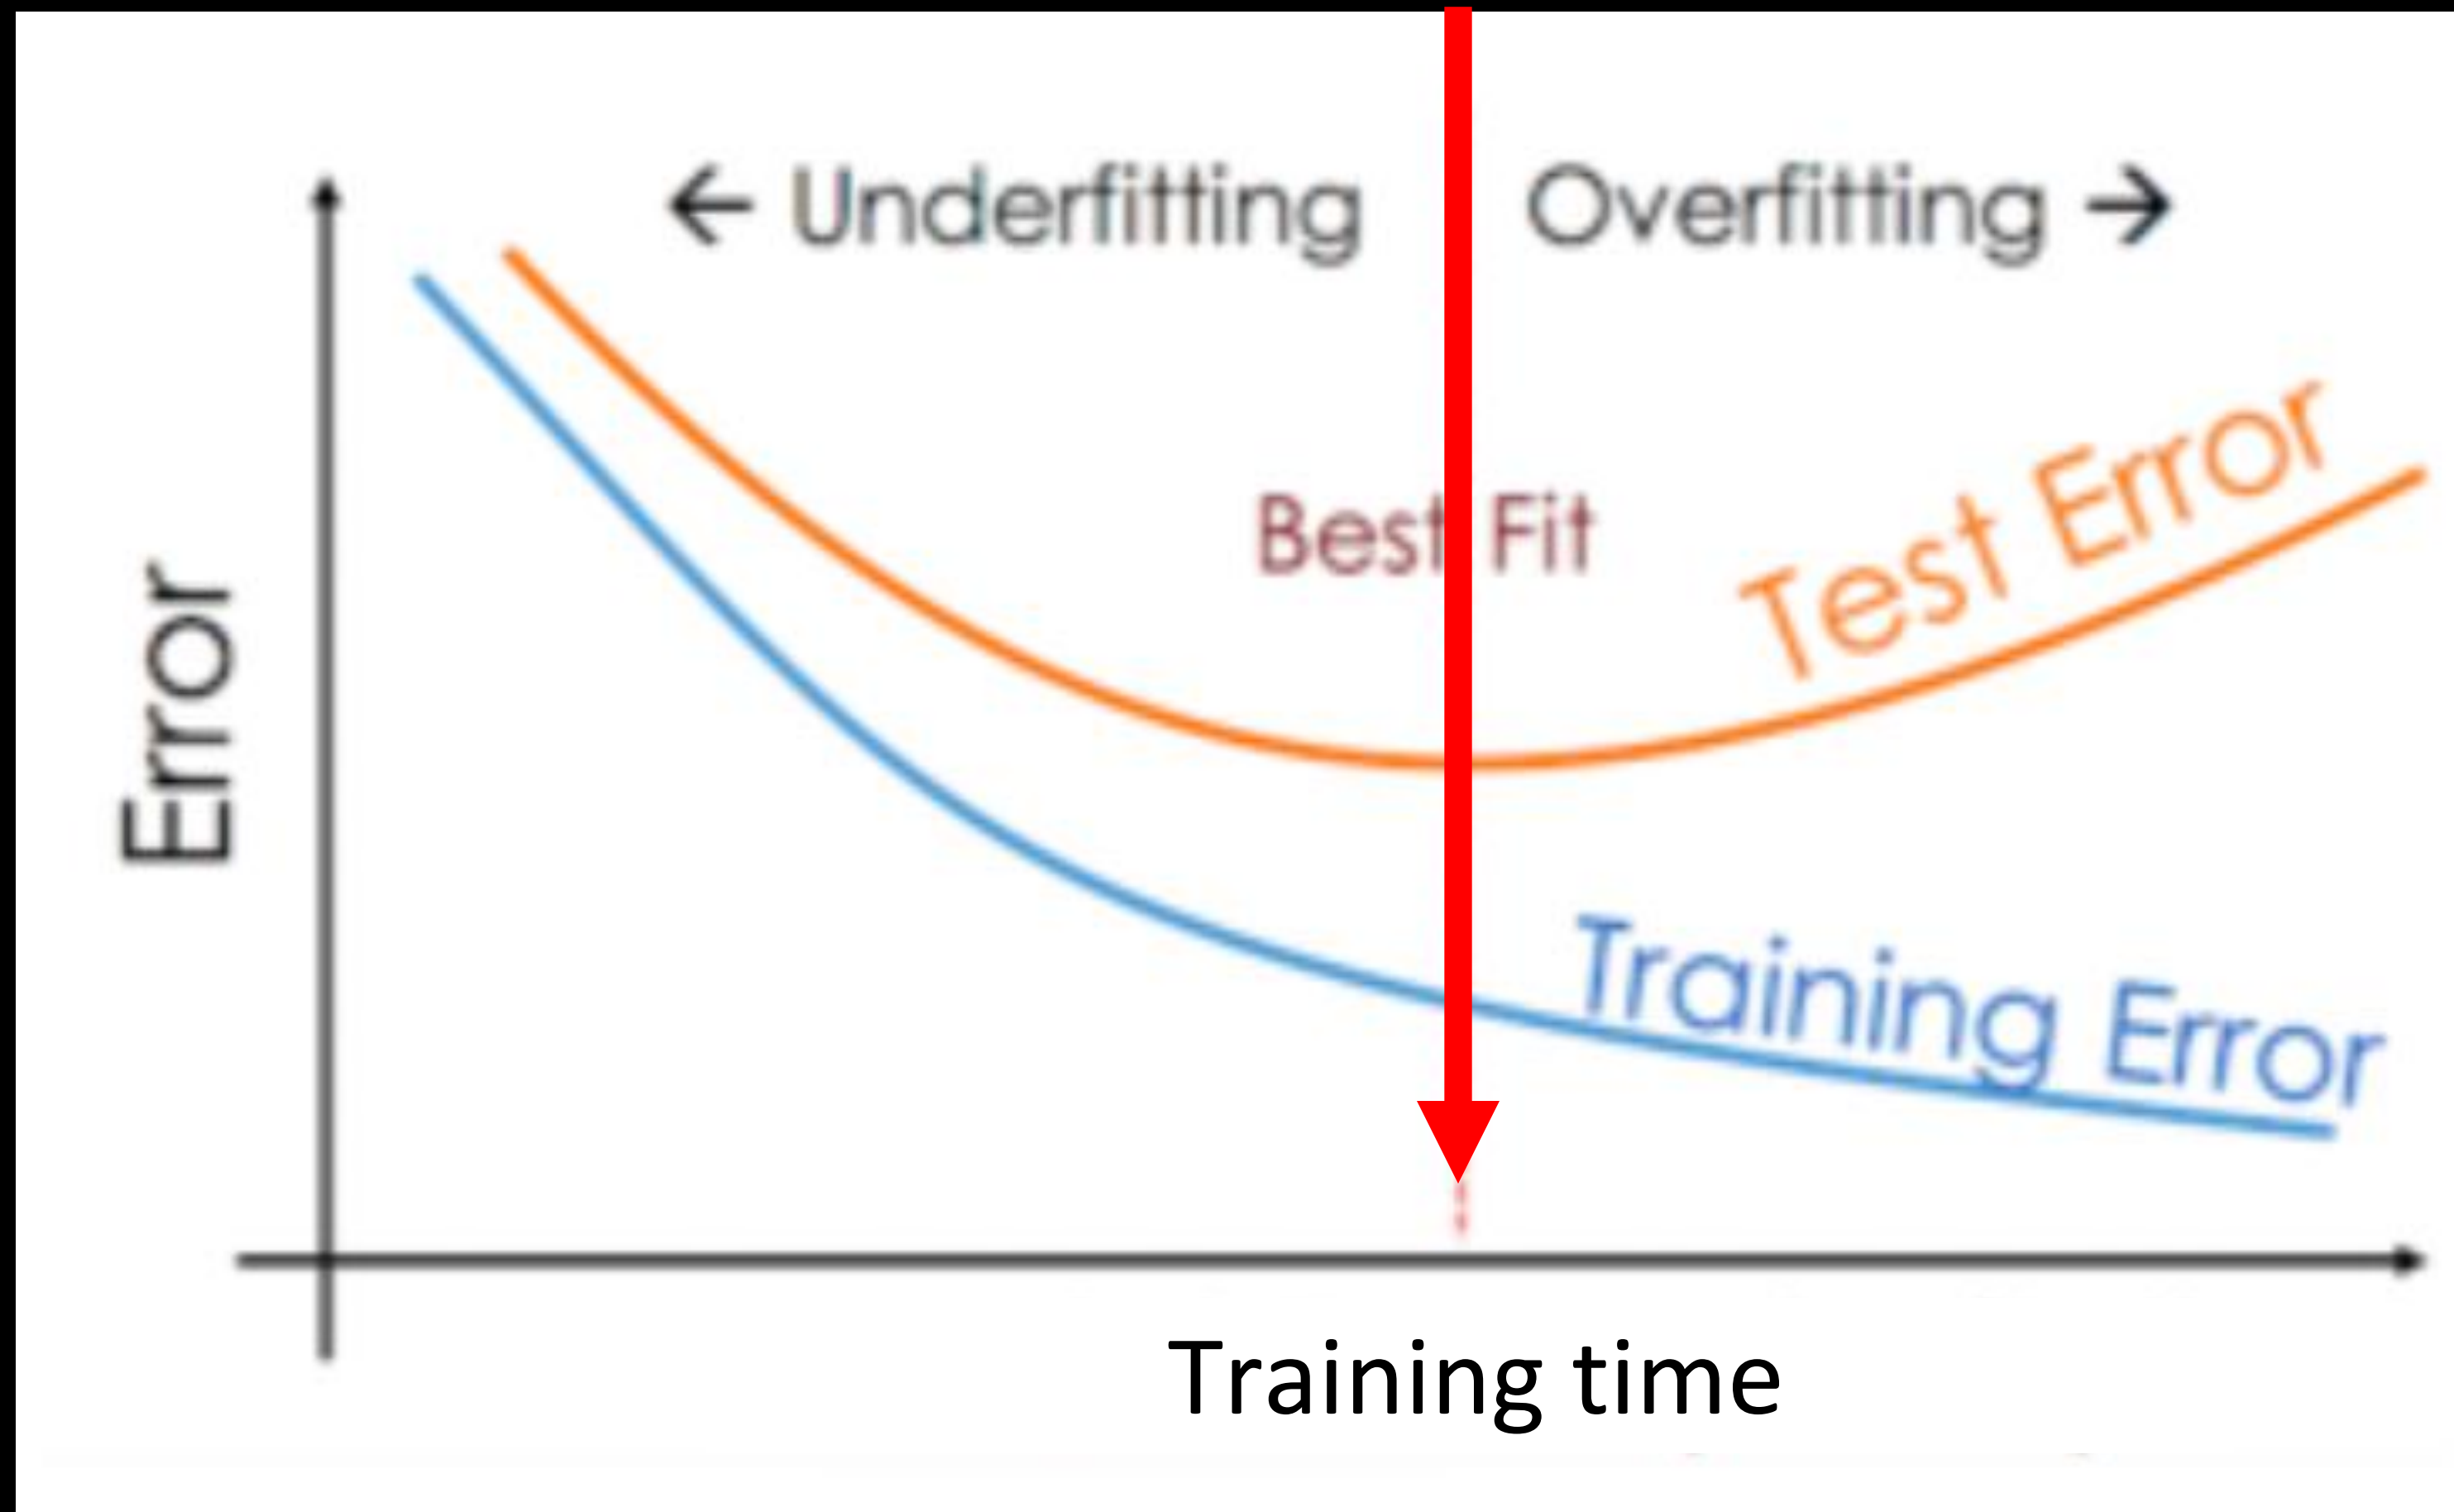

- We want an **unbiased performance estimate**
- If we evaluate on the training set, we will be overconfident
- Example: If the model just learns the solutions by heart, performance on the training data would be perfect, but the model would not generalize well to unseen data

INPUT: TRAINING CURVES & OVERFITTING

INPUT: TRAINING CURVES & OVERFITTING

EARLY STOPPING CALLBACK

```
tf.keras.callbacks.EarlyStopping(  
    monitor='val_loss',  
    min_delta=0,  
    patience=0,  
    verbose=0,  
    mode='auto',  
    baseline=None,  
    restore_best_weights=False,  
    start_from_epoch=0  
)
```

INPUT: PERFORMANCE ESTIMATION

Why would we need an additional test set, when we already have a validation set?

What's the downside of a splitting the data only once into training, validation, and test set?

INPUT: PERFORMANCE ESTIMATION

Why would we need an additional test set, when we already have a validation set?

- Hyperparameter tuning is often done based on the validation set
- Validation set thus influences model choice/performance
- **Performance estimate is no longer unbiased** and overfitting may occur

What's the downside of a splitting the data only once into training, validation, and test set?

INPUT: PERFORMANCE ESTIMATION

Why would we need an additional test set, when we already have a validation set?

- Hyperparameter tuning is often done based on the validation set
- Validation set thus influences model choice/performance
- **Performance estimate is no longer unbiased** and overfitting may occur

What's the downside of a splitting the data only once into training, validation, and test set?

- We use only one specific subset of the data to test on
- We could get a **better performance estimate** if we tested on more data

INPUT: k -FOLD CROSS-VALIDATION

4-fold validation ($k=4$)

BREAKOUT DISCUSSIONS

- What layers can typically be found in a computer vision model architecture? What are their purposes? How would you – intuitively – describe how convolutional layers work?
- Suppose you try to distinguish dogs from cats. In your training set, you have 1000 images of dogs and 100 images of cats. You test your trained model on 10 images of dogs and cats. The confusion matrix looks as follows. What's the problem and how can you try to solve it?

Ground truth	Prediction	
	dogs	cats
	dogs	cats
	10	0
	9	1

- If you're fast: Recap what the final layer and loss function look like for regression, binary classification, and multiclass classification problems.

PROJECTS MILESTONES

- 07.11. Project pitches
- 14.11. Form groups
- 21.11. Literature review
- 28.12. Dataset characteristics
- 05.12. Baseline model
- 12.12. Model evaluation
- 19.12. (Feedback session)
- 02.01./09.01. Final model optimization
- 16.01./23.01. Project presentations

LITERATURE REVIEW

- What to look for?
 - Datasets that are suitable to solve the task
OR
Tasks that are interesting to solve with a given dataset
 - General advice / best practices in the relevant field (Computer Vision, Natural Language Processing, or Time-Series Prediction)
 - Approaches that have been tried before on similar projects

LITERATURE REVIEW

- Where to look?
 - News articles / blogs
- Academic papers
- Data repositories
- ...

TASKS UNTIL NEXT WEEK

- **Complete weeks 1 and 2 of the course “Convolutional Neural Networks in TensorFlow”**
- **Complete the assignment notebook**
- **Setup a GitHub repository for your project based on the provided template (see course handbook)**
- **Conduct the literature review and upload it to your project repository**
